

Assignment 2 Part 3 Instructions

Fix your reference monitor (from Assignment 2 Part 1) so that none of the attack programs (test cases) can bypass it. There should be no accuracy/security bugs. Also, if there are any other bugs in the program that the test cases have not found, fix them too.

Assignment Link

at: <https://github.com/SeattleTestbed/docs/blob/master/EducationalAssignments/ABStoragePartThree.md>

The test cases have been attached. **If anybody's test cases are missing, please inform us immediately. I will start to run test cases against monitors soon, so please make sure your test cases are present in the attachment.**

Also, if you find any test cases which are meant for the extra credit reference monitors, you may ignore them.

What to submit:

1. The corrected reference monitor (named **reference_monitor_[netid].r2py**)
2. Your security layer should produce no output!!
